

Sample Executive Summary

Magento 2.4.9 Extension Risk Survey

Prepared by Ghost Architect™ · ghostarchitect.dev · Generated 2026-05-13

WHAT WE AUDITED

To demonstrate what a Ghost Inheritance Audit™ surfaces on real merchant codebases, we audited five widely-deployed third-party Magento 2 extensions from the [vendor/](#) folder against the Magento 2.4.9 baseline and current PHP version requirements. All five are publicly available on GitHub and free-tier. Three vendors are represented.

The same analyzers run identically against [app/code/](#) directories, where merchant-built and agency-built custom modules live. That is where most real-world risk in a Magento codebase concentrates. Your paid audit covers both layers, vendor and custom.

#	Vendor	Extension	LOC analyzed	Files loaded
1	Amasty	Wishlist (free)	85	12 of 12
2	Amasty	Import/Export Core	2,365	43 of 43
3	Mageplaza	SMTP	7,791	99 of 113
4	Mageplaza	Blog	24,572	58 of 376
5	Magefan	Blog	18,120	93 of 374

Total code analyzed: 52,933 lines across 305 files, spanning five extensions and three vendors.

TOP THREE FINDINGS

1. License compliance risk is systemic, not vendor-specific

Eight of the nine direct dependencies across the five audited extensions ship without license metadata in their composer.json manifests. This affects all three vendors. For a buyer inheriting a merchant codebase with 15 to 20 installed extensions, the cumulative license compliance gap is material. The path of least risk before a commercial transfer is a license clearance review on every paid and free extension in the merchant's vendor folder.

This pattern would not be caught by a security scan, a code review, or a manual inspection. It is structurally invisible without a tool that reads dependency manifests and flags missing metadata.

2. PHP version drift in composer constraints

Two of the five audited extensions declare PHP version ranges that include end-of-life versions:

- Amasty Wishlist (free) declares PHP 5.6.5, 7.0.2, 7.0.4, 7.0.6, 7.1.0 (EOL since 2018)
- Amasty Import/Export Core declares PHP 7.3 (EOL since 2021)

Whether or not the runtime PHP version is current, a composer constraint that admits an EOL version signals neglected dependency maintenance. Buyers of merchants with extensions like these should expect compatibility friction during the 2.4.9 PHP version jump, and may need to fork-and-patch unmaintained extensions to clear the upgrade.

3. Freemium "shell" detection. Amasty Wishlist (free)

The free version of Amasty Wishlist on GitHub is functionally an 85-line PHP skeleton with a single dependency (amasty/base). The audit found no business logic, no checkout integration, and no customer-facing functionality. The full Wishlist feature set is locked behind the paid multiple-wishlist extension.

A merchant who installed the free Wishlist module believing they were getting working wishlist functionality has, in fact, installed a placeholder that does nothing. Buyers doing a stack inventory should expect to find similar shells across the merchant's free extensions inventory and adjust their feature inventory accordingly.

WHAT THIS AUDIT DOES NOT SURFACE

Ghost Inheritance Audit™ is a pre-engagement triage tool. Specifically:

- It identifies risk patterns. It does not prove exploitable bugs.
- It does not run CVE scans against transitive dependencies.
- It does not test runtime behavior, integration paths, or production data flows.
- It does not replace a full security audit, penetration test, or operational due diligence.

The findings above are starting points for a qualified engineer or diligence team to verify. The report's value is in identifying where to look, not in delivering final answers.

WHAT YOU GET WHEN YOU BUY

Your \$497 Ghost Inheritance Audit™ includes:

1. A full Inheritance Audit run on your entire codebase. No size cap. Whether you have one custom app/code module or a hundred vendor extensions, you get the complete scan.
2. A 5-section PDF report in the same format as this sample, customized to your repository: Stack Reality Check, Key-Person Risk, Hidden Dependency Map, Modernization Roadmap.
3. A 1-page written executive summary like this one, translating the technical findings into business risk language a deal committee or executive sponsor can act on.
4. Delivery within 48 hours of payment. Signed NDA on request.

WHY THIS IS WORTH \$497

A senior consultant performing the same analysis manually takes 4 to 6 hours and bills \$150 to \$250 per hour. That is \$600 to \$1,500 in consultant time, scheduled days or weeks out.

Ghost Architect™ surfaces the same depth of findings, interpreted through nine years of Adobe Commerce architecture experience. No scheduling, no discovery calls. You get the report.

You get senior-architect judgment, delivered in 48 hours, for less than the cost of a single consulting call.

Buy a Ghost Inheritance Audit™ for \$497
